

Issue Buddy Tools

Version 1.0.0 | June 2026

Issue Buddy Tools is a collection of tools designed to assist Autodesk Revit users during the final stages of information delivery. The add-in includes **five** efficient quick-action commands that allow you to:

- Set up custom print sets using the **CreatePrintSet** command.
- Export dynamically named PDFs and DWGs using the **PDFSplitter**.
- Clean and protect project data using the **ModelStripper**.
- Visualize historical sheet revisions across the entire model via the **RevisionViewer**.

A workflow bonus tool is also included. Every feature is engineered to streamline final submittal and information delivery processes, saving countless hours.

Below is a brief overview of the tools included in this set.

1. CreatePrintSet

Use this tool to generate a Revit print set driven entirely by sheet revisions. Simply select a single revision or a range of revisions, specify a name, and click OK. It's that simple.

With this tool, you will never accidentally miss a revised sheet in your submittal package.

2. PDFSplitter

Once a print set is generated, print it to a single combined PDF using your preferred PDF driver (ensuring the option "Combine multiple selected views/sheets into a single file" is enabled). This combined file is used as the base input for the next step.

The **PDFSplitter** reads the combined document and splits it into individual files matching the page order of your print set. One by one, it generates neatly separated PDFs and accompanying DWGs.

- **Full Naming Control:** Customize your output file names dynamically using any available project or sheet parameters.
- **Reusable Templates:** Save your parameter mappings as naming presets to seamlessly match company or client information protocols.

Here is how it works:

Step 1: Select your combined **PDF** or drag and drop it directly into the target UI box.

Step 2: Select your preferred DWG **export settings**, choose the matching print set (the one used to print your combined PDF), and select or create a naming template.

Step 3: Click **Split**. The tool will process the document, generating individual PDFs and corresponding DWGs in your target output directory.

ModelStripper

The ModelStripper exports and strips a Revit model to a specified location. Users can select exactly which non-model components (such as views, sheets, legends, schedules, links, or groups) to strip away prior to export.

A central file, or a cloud based shared model will automatically become detached from it's source.

After processing, the tool automatically prompts the user to purge unused elements, trimming the file down to its most compact and secure version.

RevisionViewer

The RevisionViewer allows you to inspect both current and historical revisions across all sheets within the active Revit model. It provides a clean, table of your revision streams, making it effortless to cross-check sheet statuses, compile issue records, or generate Task Information Delivery Plans (TIDPs).

The completed matrix table can be exported directly to a CSV file for external documentation and project tracking workflows.

Revision History Viewer

Sheets Issues & Revisions History

Sheet Number	Sheet Title	Last Revision	Date	20.04.2026	10.06.2026	Author	Checker

Bonus Tool: Print Set from Selection

When Issue Buddy Tools are installed, a custom context-menu command is integrated directly into the Revit Project Browser.

Simply highlight a selection of sheets in your Project Browser, right-click, and choose **IssueBuddy -> Create Print Set from Selection**. It is fast, intuitive, and eliminates manual list building.

**Note: This specific context-menu feature is supported in Revit 2025 and higher.*
